A LOGICAL CALCULUS OF THE IDEAS IMMANENT IN NERVOUS ACTIVITY*

■ WARREN S. MCCULLOCH AND WALTER PITTS
University of Illinois, College of Medicine,
Department of Psychiatry at the Illinois Neuropsychiatric Institute,
University of Chicago, Chicago, U.S.A.

Because of the "all-or-none" character of nervous activity, neural events and the relations among them can be treated by means of propositional logic. It is found that the behavior of every net can be described in these terms, with the addition of more complicated logical means for nets containing circles; and that for any logical expression satisfying certain conditions, one can find a net behaving in the fashion it describes. It is shown that many particular choices among possible neurophysiological assumptions are equivalent, in the sense that for every net behaving under one assumption, there exists another net which behaves under the other and gives the same results, although perhaps not in the same time. Various applications of the calculus are discussed.

1. Introduction. Theoretical neurophysiology rests on certain cardinal assumptions. The nervous system is a net of neurons, each having a soma and an axon. Their adjunctions, or synapses, are always between the axon of one neuron and the soma of another. At any instant a neuron has some threshold, which excitation must exceed to initiate an impulse. This, except for the fact and the time of its occurence, is determined by the neuron, not by the excitation. From the point of excitation the impulse is propagated to all parts of the neuron. The velocity along the axon varies directly with its diameter, from $<1\ \mathrm{ms}^{-1}$ in thin axons, which are usually short, to $>150\ \mathrm{ms}^{-1}$ in thick axons, which are usually long. The time for axonal conduction is consequently of little importance in determining the time of arrival of impulses at points unequally remote from the same source. Excitation across synapses occurs predominantly from axonal terminations to somata. It is still a moot point whether this depends upon irreciprocity of individual synapses or merely upon prevalent anatomical configurations. To suppose the latter requires no hypothesis *ad hoc* and explains known exceptions, but any assumption as to cause is compatible with the calculus to come. No case is known in which excitation through a single synapse has elicited a nervous impulse in any neuron, whereas any neuron may be excited by impulses arriving at a sufficient number of neighboring synapses within the period of latent addition, which lasts <0.25 ms. Observed temporal summation of impulses at greater intervals

Estado da Arte

Compreende os mais avançados desenvolvimentos de um dispositivo, uma técnica ou um campo do conhecimento em um determinado momento.

Estado da Arte

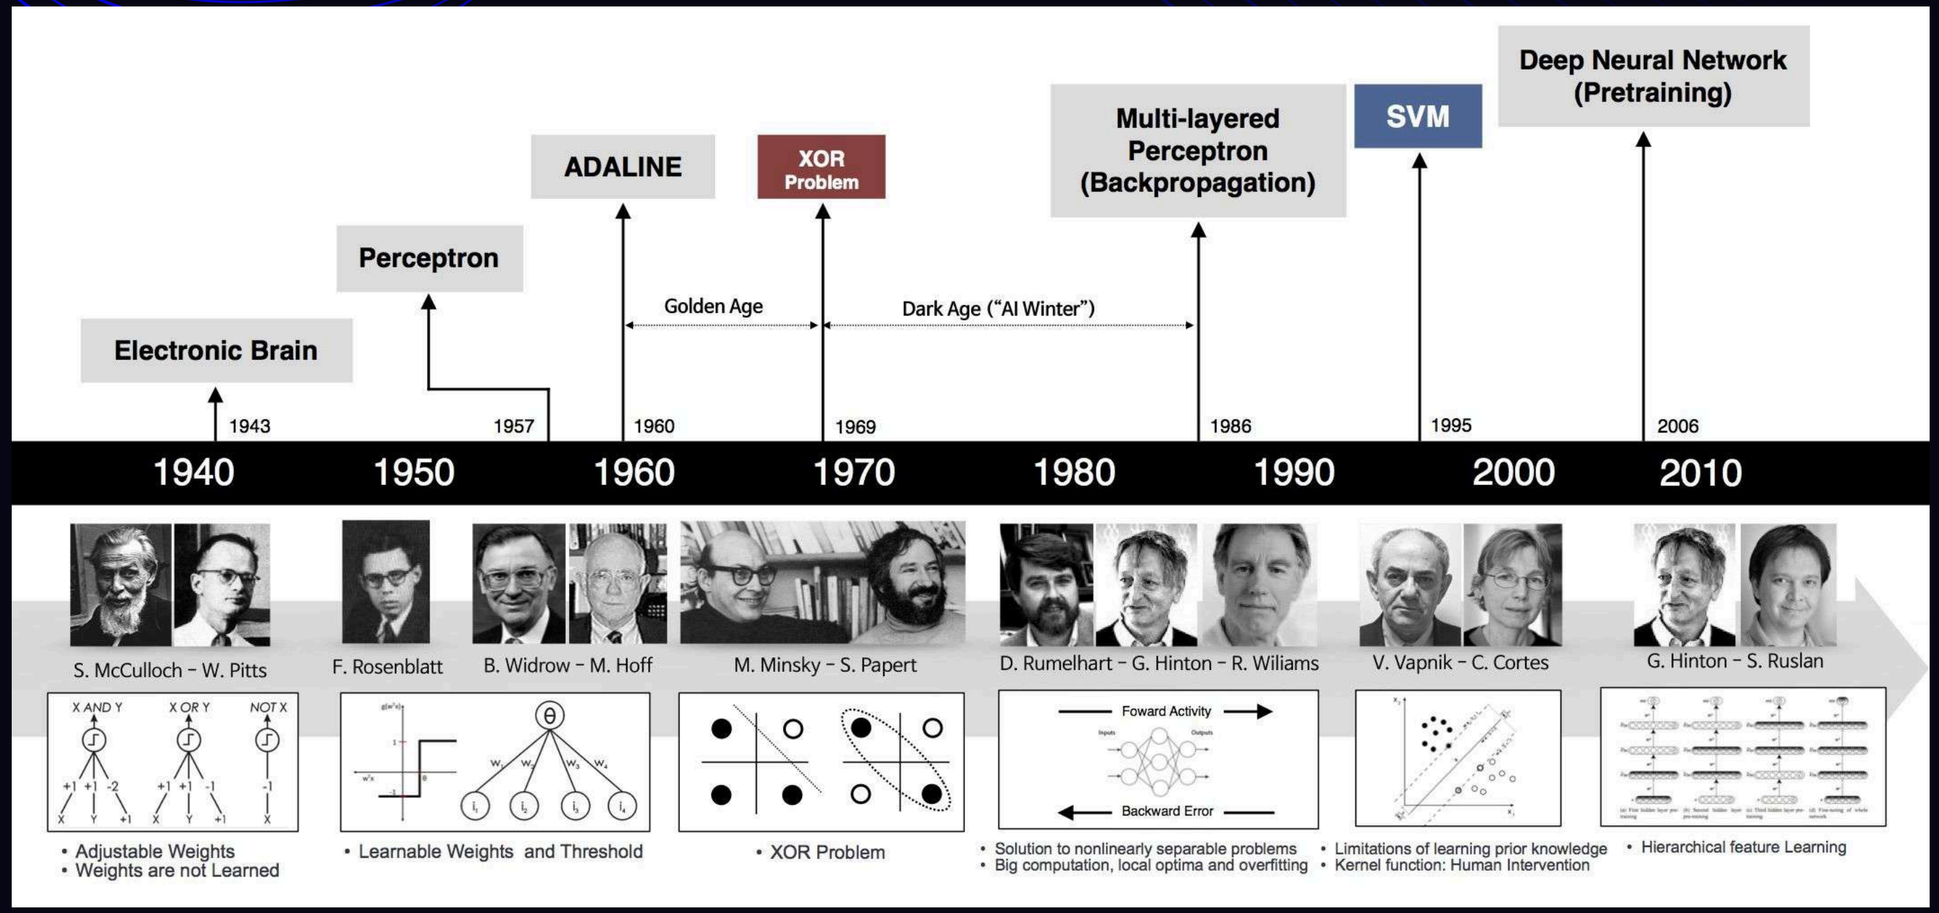
Compreende os mais avançados desenvolvimentos de um dispositivo, uma técnica ou um campo do conhecimento em um determinado momento.

Inclui também o entendimento e detalhamento do problema e de seus impactos.

Estado da Arte

- Problema
- Propostas de Soluções
- Ferramentas e Técnicas
- Tecnologia
- Produtos e práticas
- Mercado

Evolução do Estado da Arte



Importância da Pesquisa do Estado da Arte

- Situar um trabalho no estado da arte
- Adquirir o conhecimento da anterioridade
- Embasar o trabalho em resultados anteriores
- Demonstrar a relevância do problema

Pesquisa do Estado da Arte em um Trabalho Acadêmico

- É parte do trabalho, não apenas uma atividade prévia!
- Deve ser considerada no Plano de Trabalho!
- É uma atividade contínua e essencial em todas etapas do projeto!
- É importante ter uma leitura crítica das referências!

Fontes de Pesquisa

- Artigos com revisão de pares (revistas e conferências)
- Livros
- Revistas Técnicas
- Patentes
- Teses de doutorado e livre docência
- Dissertações de mestrado
- Monografias
- Relatórios de iniciação científica e conclusão de curso

Exploring types of play in an adapted robotics program for children with disabilities

Article | Mar 2018 · Disability and rehabilitation. Assistive technology

Sally Lindsay · Ashley Lam

Purpose: Play is an important occupation in a child's development. Children with disabilities often have fewer opportunities to engage in meaningful play than typically developing children. The purpose of this study was to explore the types of play (i.e., solitary, parallel and co-operative) within an adapted robotics program for children...
